Spread of 'X' Disease Fought by Veterinarians

New and deadly outbreaks of "X disease" in valuable herds of cattle were reported as veterinary leaders launched a nation-wide effort to find the answer to this new animal killer.

This strange disorder appears to be spreading rapidly and has been identified as the cause of cattle losses in more than half the states, the American Veterinary Medical association says.

To illustrate the nature of the disease, the AVMA told of a recent instance where four cows in one herd died after manifesting a variety of symptoms which refused to yield to treatment. Digestive disturbance, skin lesions, high temperature, and a sharp drop in milk production were noted. Laboratory tests indicated that none of the more familiar diseases was present.

The AVMA said veterinary leaders were co-operating with state and federal authorities in an intensive new investigation of the disease, launched under government auspices at a 16-state conference in Washington, D. C.

Characteristics of the malady, as observed in most outbreaks, include loss of weight and appetite, diminished milk production, elevation, fever, and a thickening and inflammation of the animal's skin.

So far, no drug treatment has been successful, and there is still no definite information on the cause of this disease.

Some Points to Recall When Cooking Sausages

Slow and steady is the rule to remember when cooking bacon and sausage for best flavor, tender texture and least waste, home economists say. By keeping the heat low these meat products can be cooked thoroughly without drying, hardening, or scorching.

Slow cooking has another advantage. It saves the fat in these meats from reaching the smoking point where it becomes less digestible and changes the flavor.

Turn slices when partly cooked for even cooking on both sides. Pour off the fat from the pan as the bacon cooks. When done lift onto absorbent paper to drain before serving.

Link sausage and sausage cakes may be pan-fried or oven-cooked. Take care not to prick the links when turning them with a fork because this lets out juice and flavor. To pan-fry links, place in a frying pan with a few tablespoons of water, cover and steam for 10 minutes. Then remove the cover and cook over low heat, turning frequently until the sausage is brown and any water in the pan has cooked away. To pan-fry cakes, place in a cold frying pan and cook over low heat until cooked through and brown on both sides.

Cooking sausage in the oven takes longer but is convenient and economical if the oven is being used for other foods.

Big Floods and Small

Floods on the main rivers usually occur during the winter and early spring, but floods on small streams are more likely during the summer, specialists of the U. S. department of agriculture point out. Newspapers headline the big floods which affect towns, cities, industrial areas and large farm areas in the bottomlands, but seldom mention the many floods along small streams, which may damage only parts of individual farms along the stream. Ninety years of records of flood peaks on the Ohio river at Cincinnati (a drainage area of 76,580 square miles) show that 85 floods occurred during the winter and spring months and only five in the remainder of the year. In contrast the 11 years of records of a small Ohio watershed of less than 10 square miles show only one each spring flood; the other 10 floods occurred during the summer, the growing season for crops.

How Lie Detector Works

Even though an experienced liar may suppress outward signs when he lies, there is usually some change in his blood pressure, respiration and the activity of the sweat pores. The "lie detector" is an instrument that measures these effects in a suspect. He is asked a series of questions, most of which are rather commonplace, but a few of special significance have been inserted. His reactions to these are particularly noted. Considerable practice and skill is required to interpret the readings. Various heart and other organic ailments, intoxication, influence of narcotics and abnormal mental conditions may also affect the readings.

Most Literate Indians

What is called the "only literary pension" in America was the $300 annually voted by the Cherokee Indians of North Carolina to Sequoyah, who invented the devised Cherokee syllabary of 85 characters. It was so simple that children learned to read and write in a few days, and enabled the Cherokees to become the most literate of all American Indians. At one time three-fourths of the eastern band could read and write, a degree of literacy far surpassing that of their white neighbors.

Queer Facts About Spider Revealed by Entomologist

Ticks smell with their front legs.

Spiders digest most of their food before eating.

These are some of the peculiarities of one of earth's oldest and most widely distributed animal classes, as described by R. E. Snodgrass of the U. S. department of agriculture in a report issued by the Smithsonian institution.

It is an exhaustive description of the feeding organs of the group which includes spiders, mites, and ticks.

In rocks laid down about 500 million years ago, geologists find fossils of sea animals known as trilobites—very remotely related to the spiders and crabs of today. They were the dominant form of life in their age. They were essentially jawless creatures, having only a mouth through which they probably sucked mud into the alimentary tract. They depended for their nutriment on whatever organic matter might be contained in this mud.

Since then jaws and other accessory mouth parts for grasping, tearing, crushing, and chewing have developed in the process of evolution. The spider and tick groups, however, have followed a line apart and remain about as jawless today as their ancient remote ancestors.

This is one of the ways in which they differ most strikingly from the insects, it is pointed out in Mr. Snodgrass' report.

They must live on a liquid diet. In the feeding of spiders, digestion outside the body plays an important part. A powerful digestive fluid from the stomach is discharged on the prey and completely liquefies the soft tissues.

Main Causes of Farm Fires And How to Prevent Them

Defective chimneys rank high as a cause of farm fires during the heating season. Repair cracks or other defects and replace rusted or burned out stove pipes as a first step towards preventing a fire.

Use a metal or asbestos floor covering under wood or coal burning stoves. Use double metal ventilated thimbles where stovepipes pass through frame walls or partitions.

Another group of farm fires are started by sparks on roofs. A spark arrester on your chimney will eliminate this risk. This hazard can also be reduced by installing fire-retardant roofing.

Other farm fires are due to the misuse of petroleum and its products. Every time you use gasoline, kerosene, or tractor fuel to start or hasten a fire you invite disaster. Don't gamble with leaky connections, defective equipment, or poor adjustment on kerosene stoves or oil burning furnaces.

Tank heater, feed heaters or any other type of heating equipment around your farmstead should also be checked carefully. See that they are in good condition and installed safely. Defective tank heaters, or installations too close to buildings, straw or other flammable materials lead to many costly winter fires.

Composition of Proteins

Chemically, proteins are among the most complex of all organic substances. All proteins are composed mainly of five elements—nitrogen, carbon, hydrogen, oxygen and sulfur. The most significant is nitrogen. When these elements are grouped together in various proportions the resulting compounds are called amino acids. Different amino acids combined in a variety of ways make up the many kinds of protein in plants and animals. The proteins in livestock feed are not necessarily identical with those that compose the proteins in the animal's body. In order to assimilate them, the animal, in the process of digestion, must break down the feed proteins into amino acids. These are then rearranged into compounds that can be used to build animal proteins.

Freight Rates 100 Years Ago

Today's freight rates and passenger fare may seem high, but on looking back 100 years ago, shippers and passengers alike are very much better off. According to Doggett's "Railroad Guide and Gazette of 1848," the average revenue per ton-mile in that year was 3.97 cents for first-class freight and 6.16 cents for second-class freight as against an average of 1.076 cents in 1947. Revenue per passenger-mile was reported by Doggett as 3.51 cents, while 1947's average was 2.097. Also, in 1848, the dollar had much more value than today.

Care of Inlaid Linoleum

If you want your inlaid linoleum to have lasting good looks and give long wear, give it gentle care. Too much water, strong soaps and harsh cleaning agents are the worst enemies of linoleum. Homemakers will shorten the life of their linoleum by trying too hard to keep them clean. Best method of cleaning and protecting inlaid linoleum is to wash it with a mop or cloth wrung almost dry. Warm water and mild soap may safely be used for washing. It should be rinsed with clear warm water. After it has thoroughly dried give it two thin coats of paste wax and polish thoroughly.

First Steam Engine Ran Through Cornish Streets

In 1801, a 31-year-old Englishman named Richard Trevithick successfully demonstrated an invention which was to revolutionize world economy. It was the first workable self-propelled steam engine and it pulled passengers through the streets of a Cornish town. Stationary steam power had been in use for a hundred years, but this one and those shortly afterward built to run on rails by George Stephenson actually moved.

In this day when the most fantastic scientific advances are taken as a matter of course, it is difficult to realize the skepticism toward the moving engine. They didn't believe it until they saw it; even when they saw it, some didn't believe, notes R. G. Henley of the N. and W. Ry.

Thirty-five years later in America a learned mathematician "proved" with formulae that it was impossible for an iron wheel on an iron rail to ascend even the slightest grade. William Norris, this country's first outstanding locomotive builder, conducted a public demonstration and secured affidavits from every passenger to contradict the professor.

The development of the steam locomotive to its present high efficiency is a fascinating story. Its history began in England about 1700 when Thomas Savery and Thomas Newcomen developed a crude coal-burning device for pumping water from deep coal mines.

In 1765, James Watt, a young Scottish instrument maker, was hired to repair Newcomen's engine, and succeeded in building a better and more economical one. From this improved steam engine, patented by Watt in 1769, modern locomotives can trace their beginning.

Automatic Water Supply Recommended for Poultry

Another step in the farmer's long battle to take some of the backache out of routine chores has come with the development of automatic watering systems for poultry houses.

The New York farm electrification council at Cornell university tested several automatic "freeze-proof" systems last winter that are adapted to poultrymen with small flocks, and found the cone-type system rated the best.

"It almost takes care of itself," some New York farmers reported. They said watering hens by hand takes plenty of time and labor but with an automatic supply "it's easy and fast."

Among the advantages given for the cone drinker were its low expense and installation, care in operation, and a saving of 25 to 30 per cent in labor. The device is simple and durable, with few movable parts.

Prof. C. N. Turner of Cornell, who heads the research pointed out that the need for such a drinker among small poultrymen has always been great. Chickens drink in small frequent amounts, and without water for a few hours they promptly respond with less production. An automatic water supply is the best insurance against such a hazard, he said.

Treat Poultry for Lice

Unless hens have been treated for lice and mites within six months, they may be infested with these harmful parasites, according to P. H. Gooding, leader, Clemson Extension poultry work. An infestation of either may cause the loss of several eggs per hen during a month, and this greatly lowers the income per hen during the season when eggs are selling for good prices, he points out. Lice stay on poultry at all times. To destroy them Gooding advises growers to treat their birds with sodium fluoride dust or to apply a nicotine sulphate base compound to the perches one hour before the birds go to roost. Within 10 days another application should be given the roost to destroy the lice from the eggs that have hatched during this period.

Calcium for Adults

On the basis of recent studies, the National Research council has recommended that the amount of calcium for adults be increased from .8 to one gram daily. This means that adults who have been using two cups of milk a day may want to increase this amount to three cups in order to be sure of at least meeting the requirement. Five quarts of fluid milk a week, or its equivalent in cheese, dried or evaporated milk—is recommended for adults. While that might seem like a lot, especially to those people who are not fond of milk as a beverage, there are many ways of getting that amount into the diet.

Pribilof Adventure

A naval expedition to the bleak Pribilof islands in the Bering sea brought out a large section of the population of fur seals to welcome the visitors. The USS Thuban took 4,200 tons of cargo to the island and brought back a four million dollar load of sealskins and by-products. Sparsely inhabited by human beings, the islands have a population of more than 5 million fur seals, which build cities on rookeries to raise families.

In Memoriam

In loving remembrance of my dear daughter, Edna W. Baldwin, who died February 2, 1933, 16 years ago today.
In the graveyard slowly sleeping,
Where the flowers gently wave;
Lies the one I loved so truly,
And wished so much to save.

The days are long and nights dreary
And time rolls slowly on;
But what it is to realize,
That forever you are gone.

For life without dear, Edna,
Is not the same as in the past.
What would give to
Grasp you to my breast,
Your precious face to see;
To hear your voice and see your
Smile, would mean the world to me.

Forget you I could never,
It is vain for me to try;
It'll think of you forever,
And love you 'til I die.
—Daughter.

PAULETTE - TAYLOR

The wedding of Miss Arlene Estelle Taylor, daughter of Mr. and Mrs. Lewis Henry Taylor, and Edwin Tucker Paulette, son of Mrs. W. L. Paulette and the late Mr. Paulette, took place last month in Richmond, Va. The ceremony was performed at St. John's Episcopal Church, with the Rev. Robert Bonner Echols officiating.

Immediately following the ceremony a reception was held at Hotel Jefferson, after which the couple left for a northern wedding trip.

SMITH - BANTON

Miss Carrie Ruth Banton, 363 Nicholson Avenue, Essex, Md., the daughter of Mr. and Mrs. Charles R. Banton of Appomattox, and Mr. Grover C. Smith, Jr., of Middle River, Md., son of Mr. and Mrs. Grover C. Smith, Sr., of Williamson, W. Va., were married on Saturday, January 22, at 2:30 P. M., at the Essex Methodist Church.

The pastor, the Rev. Warren E. Reese, performed the double ring ceremony.

The bride is a graduate of the Appomattox High School, class of 1944. The groom is a veteran of World War II.
